

GitHub Collaboration Workflow

Welcome to the project! To keep our codebase stable and avoid conflicts, please follow this simple checklist when working on the project.

[!IMPORTANT]

Golden Rule: Never commit or push directly to the `main` branch. Always use a separate branch for your work.

1. Before You Start Working

Always make sure your local repository is up to date before making any new changes.

- Switch to the main branch:

```
git checkout main
```

- Pull the latest changes from the remote repository:

```
git pull origin main
```

2. Creating a Branch

Create a new branch for the specific feature or bug you are working on.

- Create and switch to a new branch:

```
git checkout -b your-branch-name
```

(Tip: Use descriptive names like `feature-login`, `bugfix-header`, or `update-terms`)

3. The Pre-Commit Checklist

Before you commit your changes, review this checklist:

- [] **Tested locally?** Have I tested my changes on my local machine?
- [] **No breaking errors?** Does the application still run properly without new errors?
- [] **Focused changes?** Did I only modify the files necessary for this specific feature/fix? (Avoid committing unrelated changes).
- [] **Clean code?** Did I remove any temporary debugging code (like `console.log` or `var_dump`)?

4. Committing Your Changes

Once your checklist is complete, save your work with a clear, descriptive message.

- Stage your changes:

```
git add .
```

(Or add specific files: `git add path/to/file`)

- Commit your changes:

```
git commit -m "Briefly describe what you changed"
```

5. Pushing Your Branch

Push your newly created branch to GitHub so others can see and review it.

- Push the branch:

```
git push origin your-branch-name
```

6. Merging into Main (Pull Requests)

Once your branch is pushed, it needs to be merged into `main` using a Pull Request.

1. Go to the project's GitHub repository page in your web browser.
2. You will see a green prompt to **"Compare & pull request"** for your newly pushed branch. Click it.
3. Fill out the Pull Request details, describing what you changed.
4. **Wait for review:** Ask another collaborator to review your Pull Request.
5. **Merge:** Once approved, click the "Merge pull request" button on GitHub to safely merge your code into `main`.
